

Proactively identify patients at high risk for developing Geographic Atrophy¹⁻³

Edwin G
75-year-old man
Not an actual patient

- Medical history:**
- Family history of AMD
 - BMI: 27
 - Former smoker

- At baseline, patient's findings are consistent with intermediate, dry AMD. Four years later, OS has progressed to Geographic Atrophy (GA) with foveal involvement

Baseline visit

- BCVA: **20/40**
- Visual function: **Patient is minimally symptomatic with some difficulty seeing at night**

FAF OS

- Hyperautofluorescence indicates areas at high risk for atrophy⁴

OCT OS

- Incomplete retinal pigment epithelium and outer retinal atrophy (iRORA) is a precursor to GA
- Pigment epithelial detachment (PED) due to aggregation of drusen is a risk factor for progression to GA⁵

4 years after baseline visit

- BCVA: **20/150**
- Visual function: **Patient has stopped driving, and has trouble reading and seeing faces**

FAF OS

OCT OS

- Large area of atrophy associated with choroidal hyper-transmittance on OCT

AMD=age-related macular degeneration; BCVA=best-corrected visual acuity; BMI=body mass index; FAF=fundus autofluorescence; GA=geographic atrophy; OCT=optical coherence tomography; OD=doctor of optometry; OS=oculus sinister.

Geographic Atrophy: Visual acuity is poorly correlated with lesion size in earlier stages of the disease^{1,2}

- Change in visual acuity (VA) may not fully capture disease progression^{1,2}
- Visual function continues to decline as lesions grow²⁻⁴

Isabella C
80-year-old woman
Not an actual patient

Medical history:

- No family history of AMD
- BMI: 28
- Non-smoker with exposure to second-hand smoke
- Diabetes, hypertension

- At baseline, patient has a large area of Geographic Atrophy (GA); however, BCVA is relatively unaffected due to foveal sparing
- Within 4 years, OS GA has progressed, but BCVA has only declined slightly as fovea is still intact

Baseline visit	<ul style="list-style-type: none"> • BCVA: 20/25 • Visual function: Patient requires assistance from a caregiver with some activities (eg, cooking, driving) 	<p>FAF OS</p>	<p>OCT OS</p>
	<ul style="list-style-type: none"> • BCVA: 20/50 • Visual function: Although patient maintains relatively good BCVA, she has poor visual quality. Patient relies heavily on caregiver for assistance with many activities of daily living 	<p>FAF OS</p>	<p>OCT OS</p>

□ Although there is significant atrophy, the fovea remains relatively spared from GA

Imaging features including multifocal configuration, large size, and non-subfoveal involvement are predictors of faster Geographic Atrophy progression¹⁻³

Carla L
82-year-old woman
Not an actual patient

- Medical history:**
- Family history of AMD
 - BMI: 33
 - Former smoker
 - Hypertension, hyperlipidemia

- At baseline, patient has Geographic Atrophy (GA) with multifocal lesions outside the fovea; these lesions tend to progress faster than unifocal, subfoveal lesions
- Within 2 years, the areas of atrophy have grown and coalesced; however, the fovea still remains intact resulting in mild alteration of BCVA

Baseline visit	<ul style="list-style-type: none"> • BCVA: 20/30 • Visual function: Patient has dark adaptation issues and some difficulty reading 			
	<table border="1" style="width: 100%;"> <tr> <th style="text-align: center;">FAF OS</th> <th style="text-align: center;">OCT OS</th> </tr> <tr> <td style="text-align: center;"></td> <td style="text-align: center;"></td> </tr> </table>	FAF OS	OCT OS	
FAF OS	OCT OS			

2 years after baseline visit	<ul style="list-style-type: none"> • BCVA: 20/40 • Visual function: Patient no longer feels comfortable driving although she is legally able to. Patient relies heavily on assistance from caregiver with some activities of daily living 			
	<table border="1" style="width: 100%;"> <tr> <th style="text-align: center;">FAF OS</th> <th style="text-align: center;">OCT OS</th> </tr> <tr> <td style="text-align: center;"></td> <td style="text-align: center;"></td> </tr> </table> <p>Clear progression of perifoveal GA 2 years later</p>	FAF OS	OCT OS	
FAF OS	OCT OS
